TITLE: Investigation of certain new developers

SOURCE: Ref. zh. Astronomiya, Abs. 6.51.112

REF SOURCE: Soobshch. gos. astron. in-ta im. P. K. Shternberga, no. 159, 1965, 37-50

TOPIC TAGS: photographic chemical, photographic processing, film developer

ABSTRACT: New developers were tested with four kinds of photographic plates manufactured by the Agfa company. These were the Metol-hydroquinone developers with the addition of hydrazine (0.2 gm/liter) and triazobenzene (0.1 gm/liter), the Phini-dione-hydroquinone developer JD-67, and the Metol-phosphate developer MF. Sensitograms were obtained with the above developers in 2,4,8,16, and 32 min using the FSR-4 sensitometer. The kinetic development curves were graphed. The results are exhibited in the form of curves of sensitivity $S_{0,2}$ as function of the fog D_0 , and tables containing the entries of the sensitivity increase $S_{0,2}$ relative to that obtained with reference photographic plates developed with the Chibisov developer. It is noted that the addition of hydrazine somewhat increases the sensitivity of Astro photographic plates. For the Astro "special" and the Isopan ISS plates the best results were obtained with the hydrazine and triazobenzene developers. The addition of

Card 1/2

UDC: 522.617

ACC NR: AR6028751

only triazobenzene to the Chibisov developer caused the sensitivity of Kodak OaO plates to increase by a factor of 1.5. The Phenidone-hydroquinone and the Chibisov developers gave similar results. The Metol-phosphate developer MF gave a somewhat decreased sensitivity and very small values of γ but the fields with small density differences could be clearly distinguished. ABSTRACT : It was established that synthetic magnetite, regardless of its Fe(²⁺) content, is inactive in certain oxidation-reduction systems. The electronic transitions, required for catalytic reactions, can be brought about only by the introduction of appropriate impurities.

Reducing the breaking capacity of RTV relays. Energetik 6 no.4:27-28
Ap '58. (MIRA 11:4)
(Electric relays)

AUTHOR: Krauspe, V.P., Engineer SOV-91-58-11-12/20

TITLE: Raising the Sensitivity of Maximum Direct-action Current Protection (Povysheniye chuvstvitel'nosti maksimal'noy toko - voy zashchity pryamogo deystviya)

PERIODICAL: Energetik, 1958, Nr 11, pp 25 - 26 (USSR)

ABSTRACT: Due to the large amount of power consumed by the RTM relay and the insufficient power of the current transformers, the short circuit current is not much greater than the normal one and therefore it is difficult to provide protection for networks of 6-35 kv by means of RTM or RTV current relays built into the wires. The power given out by the current transformers depends on the magnitude of its primary current and the load impedance is determined by the value of the resistance of the RTM relay, which is 2 to 2.2 ohms at the starting moment. For this reason, the current transformer can only operate the relay in the presence of currents larger than or equal to its nominal current. However, in practice, the nominal current of the transformers is seldom 2 or more times greater than the maximum current of the line.

Card 1/2

Raising the Sensitivity of Maximum Direct-action Current Protection SOV-91-58-11-12/20

Therefore, in order that the transformer produces the necessary current to operate the relay in the presence of currents less than its nominal current, its load impedance must be increased. This can be done by increasing the number of turns on the relay winding and reducing the diameter of the wire.

AUTHOR: Krausp, V.R., Engineer SOV-91-50-4-23/29

TITLE: The Lowering of the Breaking Capacity of the "RTV" Type Relay (Snizheniye otklyuchayushchey moshchnosti rele RTV)

PERIODICAL: Energetik, 1958, Nr 4, pp 27-28 (USSR)

ABSTRACT: "RTV" type relays used in oil switch drives manufactured by the Leningradskiy zavod "Elektroapparat" (Leningrad "Elektroapparat" Plant) are mainly used for the protection of 3 to 10 kv electric installations. The transformers of the "TPF-6", "TPF-10" and other types feeding the "RTV" type relays in general have a low power. Therefore, the problem of lowering the breaking capacity of the built-in relays has become acute. Tests carried out with the "RTV" type relays of 1957 production used in "PRBA" type drives have proved that a complete slitting of the slug permits a lowering of the breaking capacity by 15 to 18 % and brings the intensity of the breaking current into line with that of the pickup current. The editor of this periodical adds the following remarks: current transformers of the "TPF-6" and

Card 1/2

SOV-91-58-4-23/29

The Lowering of the Braking Capacity of the "RTV" Type Relays

"TPF-10" types are rather powerful and meet more or less the requirements of the protection; the slug slitting of the "RTV" type relay is advisable and, therefore, the guiding slugs of relays actually being manufactured at present are being slit.

Title : Coomb's Reaction in Infectious Anemia of Horses.
(Preliminary Communication).

Orig Pub: Med. weteryn., 1956, 12, No 7, 393-395.

Abstract: When the blood of 20 horses from farms where infectious anemia was present, and of two horses supposedly infected, was examined, the findings were basically the same as in examinations of healthy control horses. Antiglobulin rabbit serum was used in diluted form in the relationship of 1:5 to 1:320.

TITLE: Iron labeling of eosinophilic leukocytes

SOURCE: Postepy higieny i medycyny doświadczalnej, v. 18, no. 4, 1964, 637-644

TOPIC TAGS: experiment animal, hematology, iron compound, vitamin

Abstract: Report of changes in eosinophils in several clinical cases during administration of iron preparations as well as experimental studies with 18 rabbits, 4 guinea pigs, 4 rats, using ferrous gluconate, "Ferrodex" (iron-dextran preparation) and "Ascofer" (ferrous gluconate with vitamin C.) The metal penetrated the true (but not the pseudo-) eosinophils by the 3rd week of administration. Orig. art. has 4 figures.

Title : Detection and Semiquantitative Determination of Minute Cobalt Amounts in Presence of Nickel.

Orig Pub : Magyar kem. folyoirat, 1957, 63, No 12, 358

Abstract : The method of chromatography on paper was applied to the detection and the semiquantitative determination of Co. The solvent (C_2H_5OH - HCl, 9 : 1) is poured in a test tube (the height of the solvent layer = 1 cm), one end of a narrow paper strip is put into the liquid and the test tube is closed. Clear spots are obtained using a paper strip of a special shape, the bottom end of which is wider (8mm) for a better suction of the solution, and the top end of which is narrow 3 mm) for

the concentration of Co. Chromatographing takes 15 to 20 min. without a developer. The bright blue Co spot is well outstanding, if the Co content was more than 10 γ . If the content was less (to 1 γ), 2%-ual NH_4SCN is added to the solvent. The semiquantitative determination of Co (5 to 100 γ of Co in the presence of 5 to 1000 γ of Ni) is possible with the use of standard chromatograms. The determination error is $\pm 5 \gamma$.
